

Emergency Response Planning and Drills

The development of an Emergency Response Plan (ERP) or Blowout Contingency Plan (BCP) is one of the key elements to having effective risk management and emergency preparedness planning. Wild Well has the experience and technical expertise to write an effective ERP or BCP for your operations. The plans developed by our team are the result of many years of implementing well control and blowout intervention operations in virtually all conceivable operational settings and geographic locations.

Pre-event well control planning benefits operations in several ways and is an excellent way to organize personnel and contractors in the event of a major well control incident. It is also a way to inform key personnel of the material and equipment requirements that may be needed for a well control job. Ultimately, this level of emergency preparedness saves time and money in the event of a well control incident.

Well Control Emergency Management

The primary objective of the ERP/BCP is to establish a process for responding to and safely managing well control emergencies. This process includes:

- Implementing actions at the emergency site that will enhance personnel safety
- Defining notification protocols and methods
- Defining critical information required to determine the appropriate response level and strategies
- Providing forms for the consistent documentation and distribution of critical information
- Organizing personnel and providing guidelines for their role in emergency response and subsequent management
- Preselecting sources and developing mobilization plans for personnel, equipment, material and services typically required for implementation of well control procedures

The process is intended to provide a framework for responding to and managing a range of well control emergencies. Working through a well-defined series of activities helps to ensure that critical aspects of the response are given adequate consideration and that proper safety and operational assessments are made at the required time.

Responding to a well control emergency with an ERP/BCP reduces risks to personnel and assets, minimizes environmental impact, promotes an earlier involvement by the well control company and demonstrates a proactive effort.

Response Drills and Exercises

A variety of WCERP and SCERP drills and exercises ensure peak readiness and competency for operational equipment and personnel.

Tabletop Exercises (WCERP) — an internal drill that reinforces incident response preparedness by working through a scenario using the processes and procedures detailed in the WCERP

Plan Rollout (WCERP) — provides an overview of the key points of the WCERP through an interactive presentation focused on well control incident levels, responses, and management

Tabletop Exercises (SCERP) — focuses on scenarios that allow each group, unit and/or branch within the source control organization to use SCERP tools, e.g., checklists, task lists, procedures, and technical data

SCERP & Logistics Plan Rollout/Implementation

— a 2-day course that provides a strategic response management overview for an incident involving an uncontrolled subsea well control event. Course covers of five modules:

- *Source Control Management Overview*
- *Logistics Planning Considerations*
- *Logistics Plan Overview*
- *SCERP Plan Overview*
- *WellCONTAINED Equipment Overview*

Well Drills and Exercises

A Well Control Response Card is a quick reference tool containing critical information that personnel on location or in the operations center can access and utilize quickly. Used as a supplement to the Emergency Response Plan, the site specific card includes:

- Information required to determine the appropriate response level
- Client specific call out notification protocol
- Site access routes
- Predetermined staging areas
- Potential risk considerations at the wellsite and adjacent areas
